

# **Hourly Attendance Monitoring System**

## **1.Introduction**

### **1.1 Overview**

In this project we will building smart hourly attendance monitoring system using Amazon Web services , such as Dynamo DB , Amazon Rekognition and many others . By building this system we can save plenty of time and efforts compared to traditional method of attendance monitoring system.

### **1.2 Purpose**

The main purpose of building this system , is to save time and efforts that is spent by thousands of people all over the world . This system also prevent attendance proxy with better accuracy and at the same time by consuming less efforts .

## **2 . Literature Survey :**

### **2.1 Existing Problem :**

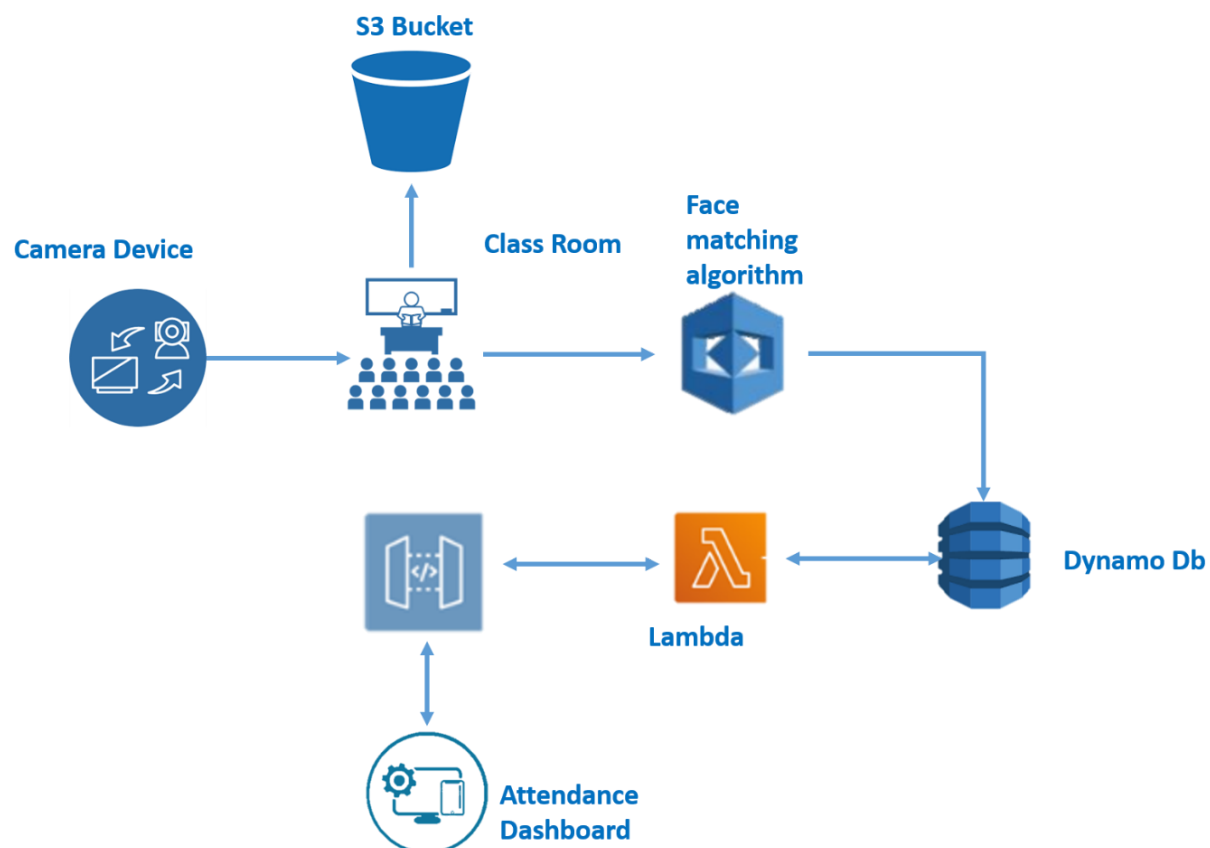

Till now in many schools teachers were taking attendance using a notebook and pen for every hour , later they consolidate the attendance of all the students in another notebook for each month . This process continues every year which is a huge time consuming and tedious process . Nowadays teachers were taking attendance manually using a mobile app which is also again a time consuming process . Hence I have developed a system which could solve these problem effectively .

## 2.1 Proposed Solution

Maintaining attendance is essential in all the institutes for checking the attendance percentage of Students. Every institute has its method in this regard. Some are taking attendance manually on the register for every hour and later they will upload every hour data of a class to the server or file-based approach and some have adopted methods of automatic attendance using some biometric techniques. However, these methods are inefficient and time-consuming, AI can definitely find a solution to this problem.

## 3 Theoretical Analysis

### 3.1 Block Diagram

## 3.2 Hardware/Software Designing

### Hardware

When we are implementing this project in real time we should use a Raspberry pi and a CCTV Camera . This camera will be connected to raspberry pi and the opencv code and the Amazon rekognition will be made to run in the raspberry pi .

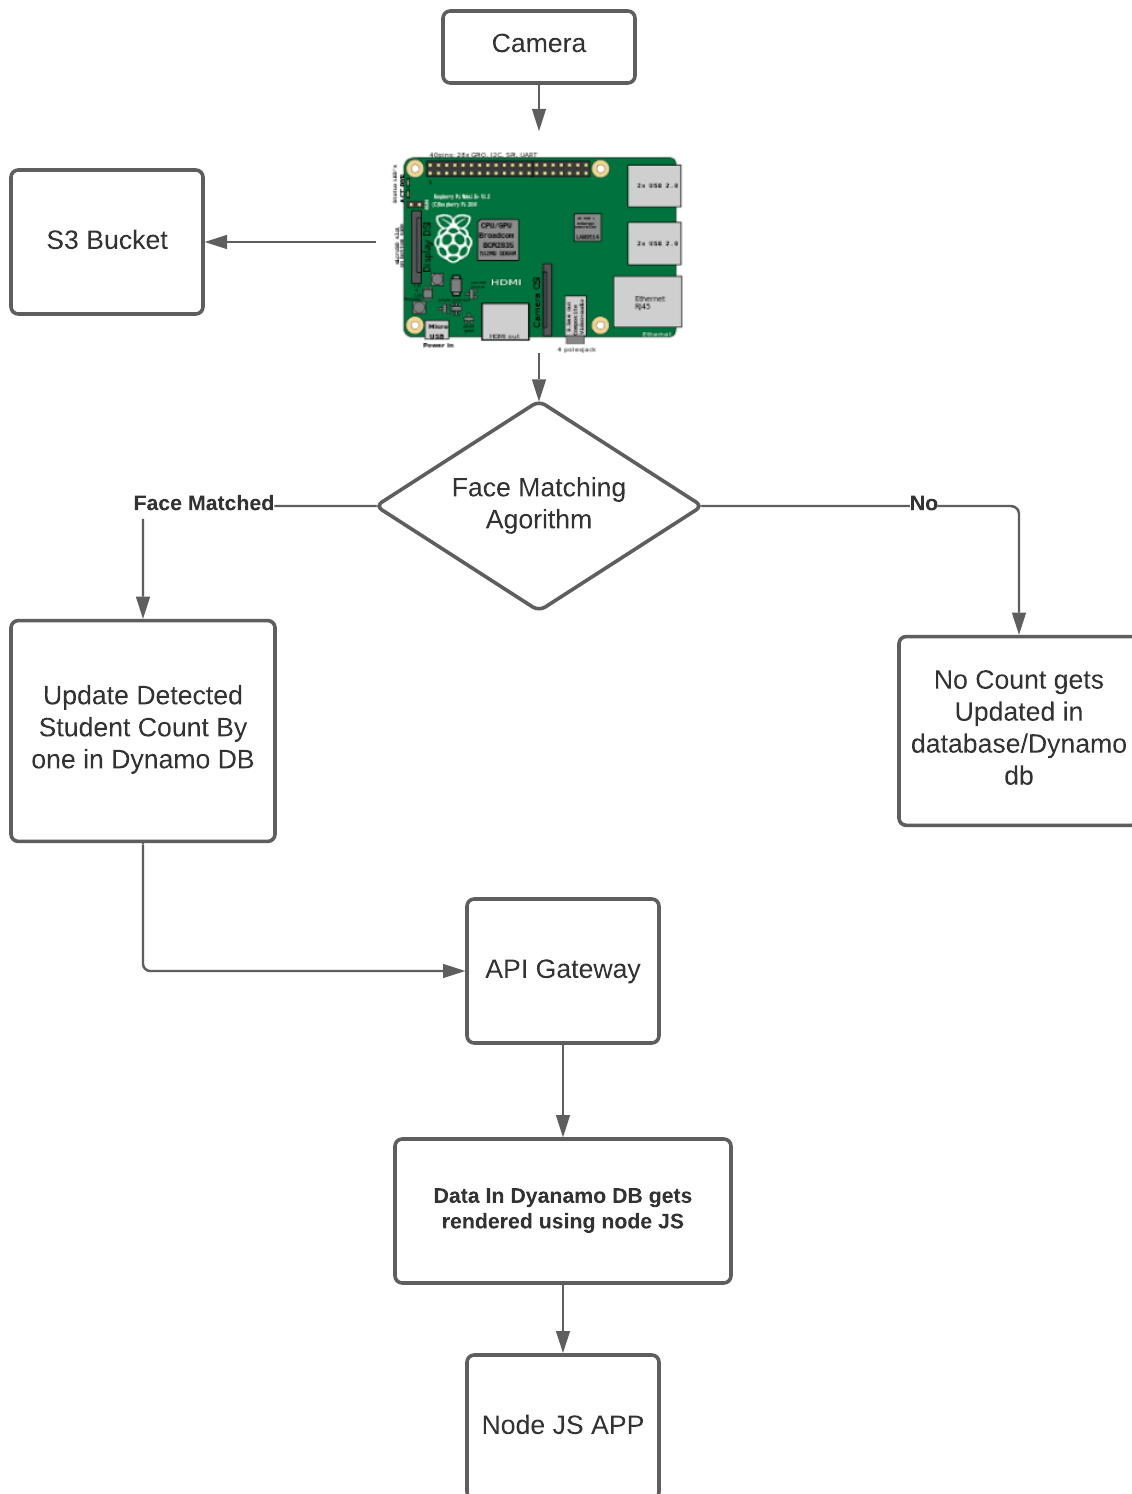

### Software

Software designing is done using Amazon Web Services as

- Amazon Rekognition
- Dynamo DB
- Lambda function
- S3 bucket
- API Gateway
- web frameworks such as Node js .

## 5.Flowchart

## 6. Result :

Below is the images of the output that I obtained

### NodeJS Dashboard

Hourly Attendance System	
Roll No	Number of Classes
61301	1
61300	2
61303	0
61304	3
61302	0

### DynamoDB Table:

The screenshot shows the AWS DynamoDB console interface for a table named 'people\_counting' within a database named 'hourlyattendance'. The table has a primary key 'Roll No' and a secondary key 'Number of Classes'. The data is displayed in a list view with 5 items.

Roll No	Number of Classes
61301	1
61300	2
61303	0
61304	3
61302	0

## Command Prompt Output :

Output printed in command prompt for every one hour

```
C:\Windows\System32\cmd.exe - python attendance_trial.py

```

## 7. Advantages and Disadvantages:

### Advantages:

- Less time consumption
- No need of manual operation
- Prevents attendance proxy
- User friendly process
- More efficient approach

### Disadvantages

- Initial high cost

- Require skilled labour for maintenance in software as well as hardware side

## **8.Applications:**

Though this hourly attendance system focuses mainly on capturing attendance in schools and colleges , the behind this idea can be used for many application such as

- workplace safety monitoring
- Replacing biometric attendance scheme by facial rekognition method
- Used in police investigation for comparing ac quest face with faces stored in database .
- Used in healthcare field .
- More useful in Industry 4.0 concepts

## **9.Conclusion:**

This is type of smart hourly attendance monitoring system will be very useful in monitoring attendance in school and college without human intervention and consumes great time as well as efforts . Though the initial cost is high it will more efficient and user friendly than conventional method .

## **10.Future Scope:**

Though this system will be useful in school and colleges , but the concept behind this idea can be applicable various sectors such as agriculture(animal intervention can be detected) , healthcare(Identifying whether the staff or patients are wearing mask or not), Industry 4.0(Workplace safety monitoring) and

many other sectors also . Hence this type of concept has huge scope in future.

## 11.Bibliography

### Appendix

#### A.Source Code

#### AWS Rekognition Code

```
1  import numpy as np
2  import cv2
3  import time
4  import boto3
5  import requests
6
7  while(True):
8
9
10     client=boto3.client('rekognition',
11                          aws_access_key_id="AxxxxxxxxxxxxxxxxxxxxN",
12
13     aws_secret_access_key="PX1UxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxZ",
14     aws_session_token="FwoGZXIvxxxxxxxxxxxxxxxxxxxx7gD4P8wobiahxyBFQFxtYrvtZ
15     UjygySu0tQ0m0U+fi1TI9XTzLy+a2X6zbkHH+SBdxxxxxxxxxxxxxxxxxxxxxxxxxxxxT

22         source_bytes=source_image.read()
23         print(type(source_bytes))
24
25         print("Recognition Service")
26         response = client.detect_custom_labels(
27
28         ProjectVersionArn='arn:aws:rekognition:us-east-1xxxxxxxxxxxx:project/xxx
29         xxxxxx/version/xxxxxxxxxxxxxxxxxxxxxx.xxxxxxxx/xxxxx',
30
31         Image={
32             'Bytes':source_bytes
33         })
```

```

27     },
28
29 )
30
31 print(response)
32 if not len(response['CustomLabels']):
33     print('Animal not identified')
34
35 else:
36     str=response['CustomLabels'][0]['Name']
37
38     url="https://i36bw98emf.execute-api.us-east-1.amazonaws.com/people_counting?rollno="+str
39     resp = requests.get(url)
40     print(resp)
41 //time.sleep(60*60)- it triggers amazon rekognition for every 1 hour
42     time.sleep(60*60);
43
44 if cv2.waitKey(1) & 0xFF == ord('q'):
45     break

```

## Opencv Code to capture image Every one hour :

```

1  import numpy as np
2  import cv2
3  import time
4
5  while(True):
6
7      cap = cv2.VideoCapture(0)
8      framerate = cap.get(5)
9
10     # Capture frame-by-frame
11     ret, frame = cap.read()
12     cap.release()
13     # Our operations on the frame come here
14

```

```

15
16
17     filename = 'E:/Co-curricular/Smartintern AI project/image.png'
18
19     cv2.imwrite(filename, frame)
20 //time.sleep(60*60) - capture image for every 1 hour
21     time.sleep(60*60)
22     if cv2.waitKey(1) & 0xFF == ord('q'):
23         break
24
25 # When everything done, release the capture
26 cap.release()
27 cv2.destroyAllWindows()
28

```

## AWS Lambda function code(Python)

```

1  import json
2  import boto3
3
4  dynamo= boto3.resource('dynamodb')
5  table = dynamo.Table('hourlyattendance')
6
7  def lambda_handler(event, context):
8      resp =
9      table.get_item(Key={"people_counting":event['people_counting']})
10     print(resp['Item']['count'])
11     count = resp['Item']['count']
12     count= count+1
13     inp = {"people_counting":event['people_counting'], "count":count}
14     table.put_item(Item=inp)
15     # TODO implement
16     # table.put_item(Item=event)
17     return "successful"

```

## Reading data from DynamoDB Code(NodeJS)

```

1  console.log('starting function');
2
3  const AWS = require('aws-sdk');
4  const docClient = new AWS.DynamoDB.DocumentClient({region:

```

```
    'us-east-1'}));  
5  
6 exports.handler = function(e, ctx, callback){  
7  
8     var scanningParameters = {  
9         TableName: 'hourlxxxxxxxxxxxx',  
10        Limit: 100  
11    };  
12  
13    docClient.scan(scanningParameters,function(err, data){  
14        if(err){  
15            callback(err, null);  
16        }else{  
17            callback(null, data);  
18        }  
19    });  
20 }
```
